A record number of the North American buildings added to the AIA's 2011 database were built using AutoCAD and its related software applications. More than one in five (21%) of the people who use AutoCAD work for an architecture firm, while the remaining are architects, engineers, and design professionals. The types of buildings that architects and engineers use AutoCAD to design include: Houses (including condos) Industrial buildings Educational facilities Health care facilities Museums Cultural centers Retail stores Office buildings Recreational facilities Houses According to the U.S. Census Bureau, in 2010, 64% of the U.S. population lived in single-family homes. However, less than half of all new single-family homes are built from scratch, with the majority being built from modular components that are trucked in from a factory. Currently, architects use these prefabricated components as a means of cost saving and streamlining the design process. In many cases, architects use CAD programs to "cage" or "paper-model" a house prior to the actual construction. Once the prefabricated components are delivered, architects assemble the house. To use AutoCAD and related software applications, architects need a host computer, monitor, keyboard, mouse, and stylus. Some architects may also need a printer, a graphics tablet (GPS, DAS), and a digitizer tablet (the latter being necessary if the architect uses AutoCAD to create 2D or 3D drawings). The typical host computer required by architects is a Dell computer running Windows or Linux. Architectural firms can choose from a variety of CAD

Licensing In general, AutoCAD LT requires a separate license from AutoCAD, and is not bundled with AutoCAD. However, in the case of installations with non-production licenses for AutoCAD LT, AutoCAD LT can be activated on the production AutoCAD installations, although the functions of AutoCAD LT will be limited. Reception Cnet wrote in their review of AutoCAD Architecture that:

But they should really be drawing their faces as if they’re sad.” That’s all well and good. But even if they were drawn sad, what difference would it make? “Women who draw their faces as if they were sad tend to be more attractive.” That is a patently false statement and would require that some researchers have access to the brain and can determine what effect sadness has on the brain. What they’re actually looking at is what was attractive in a subject’s face and a sample is a giant, big, fat, “how the F&*k do you know?” no matter the circumstances. In this case, the drawing of the image and the feelings of the subject are not the same thing. It’s like asking how
